## Passcode lock screen bypass

After reading this article, you'll learn three reliable ways to bypass the iPhone passcode, be it iPhone 6, iPhone 7, iPhone 8 or later iPhone models. If you forgot your iPhone passcode you will feel really desperate and annoyed because all iPhone data becomes inaccessible. What's worse, you can't use an iOS device at all. If you have entered the wrong password too many times, you will see an iPhone screen showing that the iPhone is disabled and you can only try to unlock the device later. If you forget your iPhone password, your exit is to bypass the iPhone passcode. So how to bypass the forgotten iPhone passcode and use the device again? Usually there are three ways you can choose from: **PAGE CONTENT: Bypass iPhone password without Siri or iTunes Remove iPhone Passcode with iTunes bypass iPhone Passcode with Siri (iOS 8.0 - iOS 10.1) How to bypass iPhone passcode without Siri or iTunes** If you want to disable your iPhone, iPad or iPod Touch without Siri or iTunes, you can log in to this iOS unlock tool – EaseUS MobiUnlock to do so. With your Unlock iPhone feature, you can remove the lock screen password, Touch ID and Face ID you set. As with iTunes, you also need to remember the Apple ID and password originally used on the device. In addition, this solution will also delete device data. The good news is that you can get files on your iDevice from your computer or other iOS devices, be it photos, videos, music, contacts, books, and more. Thus, if you want to bypass the password on your iPhone without Siri or iTunes, EaseUS MobiUnlock is a good alternative for you. **Bypass iPhone passcode with EaseUS MobiUnlock: Step 1.** Connect your iPhone, iPad, or iPod to your computer using a USB cable, and start EaseUS MobiUnlock. Click Start. Select the correct version of iOS firmware and click Download firmware. If you have downloaded firmware to your computer, click Select at the bottom of the window to select the package manually. **Step 3:** After you download or select firmware, click Test firmware to continue. **Step 4:** After the verification process, click Unlock, and then you will see the warning window. Enter the information you want in the box, and then click Unlock again to bypass the blocked or disabled iPhone, iPad, or iPod. **Step 5:** Wait patiently for the tool to bypass the blocked device. Once you're done, set up your iPhone, iPad, iPod and create a new password. **How to bypass forgotten iPhone Passcode with iTunes** **How do I Bypass iPhone 7 passcode or remove passcode on iPhone running iOS 11 or later?** The answer is to use iTunes. If you're using iTunes to restore iPhone to recovery mode, which will install the latest version of iTunes on your iOS device, you'll delete all data from your device, including the lock screen password. It is clear that using iTunes will completely wipe the iPhone. If you have previously device, you can restore data from a backup. If you do n't have you'll lose all content and settings on your iPhone, iPad, or iPod Touch. In addition, make sure you remember the Apple ID and password for the iPhone, iPad or iPod Touch, or you won't be able to use iDevice either. You can use your Apple ID password as blocking the device firmware. Using iTunes will remove the lock screen access code, but not the firmware. With this in mind, you need to remember the following information to create and use the device. **Bypass iPhone passcode with iTunes: Step 1.** Enter recovery mode on your iPhone, iPad, or iPod Touch. For iPhone 8/8 Plus and later: Press and hold the power button and one of the volume buttons until the mute slider appears. Switch the slider to turn off iPhone. Press and hold the power button and connect the device to your computer. Hold the button until the recovery mode screen appears. **Step 2:** Renew your iPhone. After you connect your iPhone to your computer, you will see a popup window in iTunes saying: There is a problem with the iPhone iPhone name that requires it to be updated or updated. In this window, select Restore to delete iPhone. (If iTunes doesn't work automatically, open iTunes by double-clicking it.) **Step 3:** Set up your iPhone. Wait for the restore process to complete. Then open your iPhone and follow the on-screen instructions to set up and use your device. **How to bypass iPhone Passcode with Siri (For iPhone 6 and earlier)** If you want to bypass the iPhone 6 passcode, you can use Siri to get it done. Using Siri bypass iPhone password is an iPhone hack on existing iOS devices that are running iOS 8.0 on iOS 10.1. You can use Siri to bypass your iPhone passcode by turning off mobile data, reading a new message, setting a reminder, and more. It's a circular way to bypass the forgotten passcode of the iPhone. However, this is the only solution if you do not want to delete iPhone data. **Bypass the iPhone access code with Siri iOS 8 on iOS 10.1:** **Step 1:** **Step 1:** Press and hold the Start button to activate Siri on your iPhone. **Step 2:** Tell Siri to set a reminder. **Step 3:** Tap the reminder you just added to open the Reminders app. Click the Home button and you will go to the Start screen. Now you have to successfully bypass the lock screen. As you know, this solution is in the works because of iOS bugs and is generally seen as a way to hack the iPhone. In newer iOS versions, Apple has fixed the issue. Thus, it only works for iPhones running iOS 8.0 on iOS 10.1. **Knowledge Base: Why you can't remove an Apple ID from a device using an Apple ID and is considered the main way to protect your privacy.** For data security on iOS devices, Apple will not be others hack your iDevice by removing your Apple ID and password. Most programs that can bypass the iPhone passcode usually can't bypass apple IDs. If some programs can do this, it's because it lowers the device to an earlier version, which is the error through which your iPhone can be hacked. We don't support any type of iPhone hacking like this. **Bottom Line** Due to one reason or another, you can forget your iPhone password and can't access its contents. If you are worried about such a situation by bypassing or removing a password, there is all you can do. The three solutions above are all in the works for tips on how to unlock the iPhone passcode. They will not only work on the iPhone, but will also help bypass the forgotten iPad passcode. If you want to solve the problem by using Siri, make sure that your device's iOS version meets the requirements. If you want iTunes, you'll need to enter recovery mode before connecting iDevice to your computer. Although if you want to bypass the iPhone passcode without Siri or iTunes using EaseUS MobiUnlock is a good choice. **Warm Tips:** As you can see, it's expensive to bypass the forgotten iPhone, iPad or iPod passcode because you'll probably lose all data on your device. If you're not sure you can always remember the password you've set, write it down or take notes somewhere else. If somehow you forget the model, PIN or password that blocks your Android device, you may think you're in luck and you're supposed to block it forever. These security methods are difficult to crack with design, but in many cases, it is not completely impossible to break into a locked device. There are several different ways to hack a locked Android smartphone or tablet, but unfortunately, there's nothing as simple as a password cracker USB memory that you can get windows. So below, I'll go over 7 of the most effective methods, and hopefully one will help you get back to your device. For most Android phones and tablets, the best guess is the built-in Find My Device service. While you are logged in to your Google Account, you can use any device or computer to access the service available at this link. From our testing we have noticed that this method does not work android 8.0 or later. But as long as your phone is running Android 7.1.1 Nougat or lower, it should do the trick. As counterintuitive as it may seem, start by clicking the Lock button when Find My Device gets set on your phone. If the service is having trouble finding your device, click the refresh button next to the phone name several times, and you must connect within 5 attempts if your phone is compatible. After you click the Lock button, you'll be prompted to enter a new password that will replace the model, PIN, or password you forgot. Type your new password twice to confirm your choice, and then click the Block button. It may take up to 5 minutes from here until the password can be changed, but when it happens, you can enter your new password to unlock the device. If you have a Samsung device, a similar find my mobile service should be the first thing you can try. Start with a position on this link from any web browser, then log in to your Samsung account. If you never create a Samsung account, this method will not work, unfortunately. Also, some carriers, such as Sprint, block this service, which is something to keep finding. When you're logged in to your Samsung account, click the Lock my screen button in the left pane. From here, enter a new PIN in the first field, and then click the Lock button at the bottom of the screen. After a minute or two, you'll need to change your lock screen password to the PIN you just entered, which you can use to unlock your device. If your device is running Android 4.4 or later, try using The Lost Article feature. After 5 failed unlock attempts, you receive the message Try again for 30 seconds. While this message is displayed, tap the button at the bottom of the screen with the text Forgot article. Choose Enter Google Account information here (depending on your device, you can go directly to this option), then enter your primary Gmail account and password. Google will either send you an email with your unlocking model, or you can change it right then and there. If you're more concerned about getting to your phone than you are with saving the data stored on it, factory reset needs to work in many cases. However, thanks to a new anti-reset feature called Factory Reset Protection, you need to know the password for your Google Account to use this method if your phone was released in 2016 or later. The process will vary depending on the type of device, but start with the full power off feature for most phones. When the screen turns black, press and hold the volume down and power buttons simultaneously that weath the Android bootloader menu. From here, press the volume down button twice to highlight Recovery mode, then press the power button to select it. Then hold down the power button and tap the volume up button once, then enter recovery mode for your phone. From here, use the volume buttons to highlight wipe data/factory reset, then press the power button to select it. When the process is complete, select reboot system now, and you should no longer be locked from your phone. If it's a newer phone, you'll be prompted to log in using a Google Account and a password that was previously used on your device before it was reset. As long as you know this information (and you should), it's just a matter of ingly ing into your Google Account to regain access to your phone at this point. This next option will only work if you have previously enabled USB debugging on your phone, and even then it will only work if you allowed the computer you are using to connect using ADB. However, if you meet these requirements, it's the perfect way to unlock your device. Note, however, that encryption enabled by default may not be compatible with this solution. Start connecting your phone to your computer using a USB data cable, and then open the Command Prompt window in the ADB installation directory. From here, type the following command, then press Enter:adb for shell rmdir/data/system/gesture.key Next, reboot your phone and secure the lock screen would be gone, allowing you to access your phone. But it's only temporary, so be sure to set a new model, PIN, or password before you reboot again. If the lock screen you're trying to bypass is a third-party program, not a stock lock screen, booting in safe mode is the easiest way to bypass it. For most phones, you can boot into safe mode by opening the power menu on the lock screen, and then pressing Off for a long time. Choose OK here when asked if you want to boot in safe mode and when the process is complete, your third-party lock screen app will be temporarily disabled. From here, simply clear or uninstall data about the third-party lock screen app, then reboot your phone to return from safe mode. Once you get back up, the troublesome lock screen app would be gone. Finally, if your device is encrypted and running Android 5.0-5.1.1, there is a way to bypass the password lock screen. This method will not work on another type of secure lock screen, but it is a lifesaver if you forget your password. First, on the lock screen, tap Emergency call, and then use the dialing interface to enter 10 stars. Double-tap the field from here to highlight the text you entered, and choose Copy, then paste it into the same field to essentially double the number of characters you entered. Repeat the same copy and paste process to add more characters until double-tap fields no longer remove characters. Then go back to the lock screen and open the camera shortcut. From here, swipe down on the notification shading and tap the settings icon, then you will be prompted to enter the password. Hold down the input field and choose Paste, and then repeat the process several times. After all, after you've pasted enough characters into the area, your lock screen will crash, which will allow you to access the rest of the phone interface. Which method worked in your city? Do you know about any other hacks that bypass android lock screen? Let us know in the comments section below.
